## Chapter 1

# Ice Beacon Data

### 1.1 Critical Summary

This is a data management workflow 1 process.

Ice beacons were built by Solara Communications and David Babb for the BaySys project /emphTeam 1 - Climate and Marine System - Sea Ice. 16 ice beacons were deployed on the *2017 Churchill River and Mobile Ice Survey* campaign, and 10 ice beacons were deployed on the *2018 Hudson Bay Amundsen* campaign. The GPS location data recorded by the ice beacon is transmitted via Iridium to the Solara online data portal. The 2017 data tracks the drift of individual ice floes and the relative drift of ice beacons deployed in pairs or in array of the mobile ice pack offshore from Cape Churchill in southwestern Hudson Bay. The 2018 data tracks the movement of the ice pack and gains insight into the double gyre current movement about the Leg 1 region of the Hudson Bay.

#### 1.1.1 Data Management Tools

1. **Ice Beacon Python Script:** Written by Victory Iyakoregha. Inputs both the Raw Churchill .csv ice beacon files and the Raw Amundsen .xlsx ice beacon files and outputs both as .csv files. The python script strips unnecessary columns, and calculates the speed and distance travelled of ice beacons using python functions that read the GPS and timestamp data. The processed ice beacon data-files are organized as a single processed ice beacon dataset.

## 1.2 Initial Data

### 1.2.1 Raw Ice Beacon Files

#### Dataset Description

The ice beacons record their GPS location at regular intervals set by the researcher until the ice floe breaks up and they sink. Two raw ice beacon datasets exist which are both **Data Level 0**:

1. Raw Churchill ice beacon files .xlsx
2. Raw Amundsen ice beacon files .csv

#### File Name(s)

- **Raw Churchill Ice Beacon Files:** 01.xlsx, 02.xlsx, 03.xlsx, 04.xlsx, 05.xlsx, 06.xlsx, 07.xlsx, 08.xlsx, 09.xlsx, 10.xlsx, 11.xlsx, 12.xlsx, 14.xlsx, 15.xlsx, 16.xlsx, CT.xlsx
- **Raw Amundsen Ice Beacon Files:** 13.csv, 17.csv, 18.csv, 19.csv, 20.csv, 21.csv, 22.csv, 23.csv, 25.csv, 26.csv

#### File Source and Location

Raw CSV files are received from Dr. David Babb. These files are then stored on [GitLab](#).

**Dataset Variables**

Table 1.1: Variables in Raw Churchill data files

Header	Description	Data Type	Range or Expected Values	Units
V1	Beacon ID	Identification name and number	N/A	(assigned name of beacon) CEOS (IMEI)
V2	GPS Latitude	Latitude	[-90, 90]	DDmm.mmmmn (n='N' or 'S')
V3	GPS Longitude	Longitude	[-180, 180]	DDDmm.mmmmn (n = 'E' or 'W')
V4	Year	date	N/A	YYYY
V5	Month	date	N/A	MM
V6	Day	date	N/A	DD
V7	Hour	time	N/A	HH
V8	Minute	time	N/A	MM
V9	Second	time	N/A	SS
V10	Battery Voltage of ice beacon	rational	N/A	Volts
V11	Internal Temperature of ice beacon	rational	N/A	Degrees Celcius

Table 1.2: Variables in Raw Amundsen data files

Header	Description	Data Type	Range or Expected Values	Units
Name	Beacon ID	Identification name and number	N/A	(assigned name of beacon) CEOS (IMEI)
Lat	GPS Latitude	Latitude	[-90, 90]	DDmm.mmmmn (n='N' or 'S')
Long	GPS Longitude	Longitude	[-180, 180]	DDDmm.mmmmn (n = 'E' or 'W')
Timestamp	Date and time of measurement	datetime	N/A	YYYY-MM-DD HH:MM:SS (time zone)

**Note:** The following variables/column headers exist on the file, but are not relevant to this analysis and were stripped by the Python script: “id”, “serial”, “message”, “hdop”, “pdop”, “speed”, “altitude”, and “heading”.

## 1.3 Scripts and Analytical Processes

### 1.3.1 Scripts

**Script Type:** Python

**Files(s) In:** clean CSV files

**File(s) Out:** converted CSV files

#### User Instructions

1. Download Python scripts **process\_ice\_beacon\_files.py** and **ice\_beacon\_files.ini** from [CanWIN's Datahub](#).

### 1.3.2 Analytical Processes

1. **Import:** os.
2. **Import:** configparser.
3. **Import:** pandas **as** pd.
4. **Import:** datetime **from** datetime.
5. **Import:** math **as** m.
6. **Import:** lonlat, distance **from** geopy.distance.
7. Run **Python** script detailed below.

## 1.4 Ice Beacon File Conversion

**Script Type:** Python Script

**File(s) In:** The collection of cleaned Ice Beacon CSV files

**File(s) Out:** The collection of converted Ice Beacon CSV files

### 1.4.1 Intermediate Files

#### User Instructions

1. Download Python scripts `_Ice_beacon_files.py` [here](#).
2. In `Ice_beacon_files.ini` provide the path to the ice beacon data directory in the Input Directory
3. In `Ice_beacon_files.ini` provide the path to the destination folder for converted Ice Beacon files in Processed Directory
4. Click "Run" at the top of the script window. The script may take several minutes to complete

#### Back-End Details

**Libraries Used:** Python `os`, `configparser`, `pandas (pd)`, `datetime`, `math (m)`, `lonlat` and `distance (geopy.distance)`

#### Analytical Process

This is a single-script Python application that performs the following tasks:

1. **Open\_files** imports the previously cleaned **CSV** files from the `Basys` and `Churchill` folders.
2. **Clean\_csv** accepts a single parameter, taking the dataframe for the CSV file, processing it, and returning it to `open_files` location. `Clean_csv` takes the original timestamp format and changes it to match the format of year-month-day and hours-minutes-seconds.
3. Column "message" takes "Battery Voltage" and "Internal Temperature", which are split by a whitespace, and put into their own columns "Battery Voltage" and "Internal Temperature".
4. "name", "lat", "long", and "timestamp" are renamed as: "Beacon ID", "Latitude", "Longitude", and "Timestamp", respectively.
5. "hdop", "pdop", "speed", "altitude", and "heading" are removed.
6. **Clean\_excel** accepts a single parameter, taking the dataframe for the CSV file, processing it, and returning it to `open_files` location. `Clean_excel` takes the original timestamp format and changes it to match the format of year-month-day and hours-minutes-seconds.
7. `Clean_excel` adds the column titles: "Beacon ID", "Latitude", "Longitude", "Timestamp", "Battery Voltage", and "Internal Temperature".
8. **Clean\_CT\_file** accepts a single parameter, taking the dataframe for the CSV file, processing it, and returning it to `open_files` location. `Clean_CT_file` takes the original timestamp format and changes it to match the format of year-month-day and hours-minutes-seconds.
9. `Clean_CT_file` adds the column titles: "Beacon ID", "Latitude", "Longitude", "Timestamp", "Battery Voltage", and "Internal Temperature".

10. **Calc\_distance** accepts a single parameter, taking the dataframe for the CSV file, processing it, and returning it to open\_files location.
11. This function calculates the distance between every two points, in this case, the two points being each two rows of data using the difference between the latitude and longitude of each point.
12. **Calc\_speed** accepts a single parameter, taking the dataframe for the CSV file, processing it, and returning it to open\_files location.
13. This function calculates the speed between every two points, in this case, the two points being each two rows of data using the difference between the distance calculated in calc\_distance() and timestamp.
14. **Main()** runs the script.

## 1.5 Vocabulary Standardization and metadata addition

Column headers are standardized in accordance with the [NERC Vocabulary](#), and units added after an underscore(\_).

Additional metadata were added to the data files:

project\_name, platform\_name, distance\_result\_value\_type, speed\_result\_value\_type

### Final Column Names

Column headers after standardization are as follows:

project\_name, platform\_name, beacon\_ID, latitude\_DD, longitude\_DD, date\_time, battery\_voltage\_V, internal\_temperature\_C, distance\_m, distance\_result\_value\_type, speed\_m\_s, speed\_result\_value\_type.

### Final File Names

Churchill2017\_01\_processed.csv

Churchill2017\_02\_processed.csv

Churchill2017\_03\_processed.csv

Churchill2017\_04\_processed.csv

Churchill2017\_05\_processed.csv

Churchill2017\_06\_processed.csv

## 1.6 Final Output Data Files

### 1.6.1 Cleaned and Compiled Ice Beacon Data

#### File Source and Location

Ice beacon files can be located on CanWIN's Datahub [here](#).

#### Final Dataset Variables

Table 1.3: Variables in the final data file

Header	Description	Data Type	Range or Expected Values	Units
project_name	Name of the project	string	N/A	None
platform_name	Name of the platform from which data was collected	string	N/A	None
beacon_ID	Ice beacon identification number	Index	N/A	None
latitude_DD	North-south directing lines of parallels	Rational	(0-90)	Degrees
longitude_DD	East-west directing lines of meridians	Rational	(0-180)	Degrees
date_time	Timestamp at the start of collection	Datetime	N/A	None
battery_voltage_V	Operating battery voltage of the ice beacon	Rational	Range	Volts (V)
internal_temperature_C	Internal temperature of the ice beacon	Rational	Range	Degrees Celcius
distance_m	Distance calculated between two points of data using latitude and longitude	Rational	Range	Metres
distance_result_value_type	Identifies real or calculated data	string	N/A	None
speed_m_s	Speed calculated between two points using the difference between the distance calculated in <code>calc_distance()</code> and timestamp	Rational	Range	Metres/Second
speed_result_value_type	Identifies real or calculated data	string	N/A	None

## Chapter 2

# Reference Tables

### 2.1 Data Levels

**Level 0 – Raw data:** unprocessed data and data products that have not undergone quality control. Depending on the data type and data transmission system, raw data may be available within seconds or minutes after real-time. Examples include real-time precipitation, streamflow, and water quality measurements

**Level 0.1 – First pass QC:** A first quality control pass has been performed to remove out of range and obviously erroneous values. These values are deleted from the record. E.g: Online Environment Canada stream-flow data, laboratory data

**Level 1 – Quality Controlled Data:** Data that have passed quality assurance procedures such as Level 0.1 and have been further quality controlled by data provider before being submitted to CanWIN (e.g. Idronaut data with only downwelling (upwelling data removed) data included.

**Level 1.5 – Advanced Quality Controlled Data:** Data have undergone complete data provenance (i.e. standardized) in CanWIN. Metadata includes links to protocols and methods, sample collection details, incorporates CanWIN's or another standardized vocabulary, and has analytical units standardized. Note: Process still under development in CanWIN (as of May 13, 2020).

**Level 2 – Derived Products:** Derived products require scientific and technical interpretation and can include multiple data types. E.g.: watershed average stream runoff derived from stream-flow gauges using an interpolation procedure.

**Level 3 – Interpreted Products:** These products require researcher (PI) driven analysis and interpretation and/or model-based interpretation using other data and/or strong prior assumptions. E.g.: watershed average stream runoff and flow using streamflow gauges and radarsat imagery

**Level 4 – Knowledge Products:** These products require researcher (PI) driven scientific interpretation and multidisciplinary data integration and include model-based interpretation using other data and/or strong prior assumptions. E.g.: watershed average nutrient runoff concentrations derived from the combination of stream-flow gauges and nutrient values.

## 2.2 Result Value Qualifiers

**ADL** - Above Detection Limit

**BDL** - Below Detection Limit

**FD** - Field Duplicate

**LD** - Lab Duplicate

**\$** - Incorrect sample container

**EFAI** - Equipment failure, sample lost

**FEF** - Field equipment failed

**FEQ** - Field Equipment Questionable

**FFB** - Failed. Field blank not acceptable

**FFD** - Failed. Field Duplicate

**FFS** - Failed. Field spike not acceptable

**H** - Holding time exceeded

**ISP** - Improper sample preservation

**ITNA** - Incubation time not attained

**ITNM** - Incubation temperature not maintained

**JCW** - Sample container damaged, sample lost

**NaN** - Value is missing and reason is not known

**NC** - Not collected

**ND** - Not detected

**NR** - Sample taken/measured on site but information in this field not recorded

**NS** - Sample collected but not submitted

**OC** - Master Coordinate List Used

**P** - Analysis requested and result pending

**prob\_good** - probably good value. Data value that is probably consistent with real phenomena but this is unconfirmed or data value forming part of a malfunction that is considered too small to affect the overall quality of the data object of which it is a part

**prob\_bad** - probably bad value. Data value recognised as unusual during quality control that forms part of a feature that is probably inconsistent with real phenomena

**Interpolated** - This value has been derived by interpolation from other values in the data object

**Q** - Below limit of quantification (LOQ). The value was below the LOQ of the analytical method. The value in the result field is the limit of quantification (limit of detection) for the method

## Chapter 3

# Options and Packages

## 3.1 Python

### 3.1.1 Python Script-Specific Options

- **os** -os is a Python module, part of the standard library on Python. Therefore, it comes with Python but still needs to be imported.
- **Configparser** - Configparser is a Python class which implements a basic configuration language for Python programs. It provides a structure similar to Microsoft Windows INI files. ConfigParser allows to write Python programs which can be customized by end users easily.
- **pandas** - Pandas is another Python module that allows the user to import CSV (comma separated values) files. Importing pandas using the pd prefix avoids overlap with other Python tools.
- **datetime** - Datetime is the Python module containing: date, time, and datetime.
- **math** - m is a mathematical calculations module of Python.
- **lonlat, distance** - Importing lonlat, distance from geopy.distance takes x-longitude, y-latitude, and optionally, z-altitude values and gives you the coordinates as a point.

### 3.1.2 Python Packages

Visit <https://docs.python.org/3/library/> to learn more about python packages

- **DateTime** - Date/time values
- **geopy** - Uses geocoding to locate addresses, cities, towns, etc.

**Example:** Section 2.1 from Victory's semi-hemi codebook.

# Glossary

**Data Management Workflow 1** - one of three data management workflows used at CEOS. Workflow 1 is used for data that is managed directly by CEOS from instrument collection to data sharing. 1
