Name	CEOS/NSIDC Extratropical Cyclone Tracking (CNECT) Algorithm
Description	This algorithm has two steps: 1) detection of cyclone centers and areas and 2) tracking of those features. Center detection is based on local minima in sea-level pressure (within a 200 km radius) that have a pressure gradient of at least 7.5 hPa/1000 km. The area of storms and presence of single- and multi-center cyclones are determined using last-closed isobars. Tracking is based on the nearest neighbor to a predicted cyclone propagation location. Cyclone size, intensity, propagation, and interactions (e.g., splitting and merging with other storms) are tabulated at each observation time.

Name	Northern Hemisphere Extratropical Cyclone Tracks from ERA-5
Description	Individual cyclone tracks for the Northern Hemisphere. Detection and tracking are conducted using version 13.2 of the Lagrangian cyclone detection and tracking algorithm described by Crawford et al. (2021). Click on any file to download.

Name	Cyclone Parameters File
Description	This cyclone parameters file records the input parameters used for the cyclone detection and tracking code to produce the files in this database. It can be opened using pandas in Python via <code>pandas.read_pickle(\$FILEPATH\$)</code> , where <code>\$FILEPATH\$</code> is the path to where this file is stored on your computer.
